## Boost food reserves now

If there are people out there who still doubt that climate change is a man-made phenomenon with a deep impact on food security, then it is time those doubts were laid to rest.

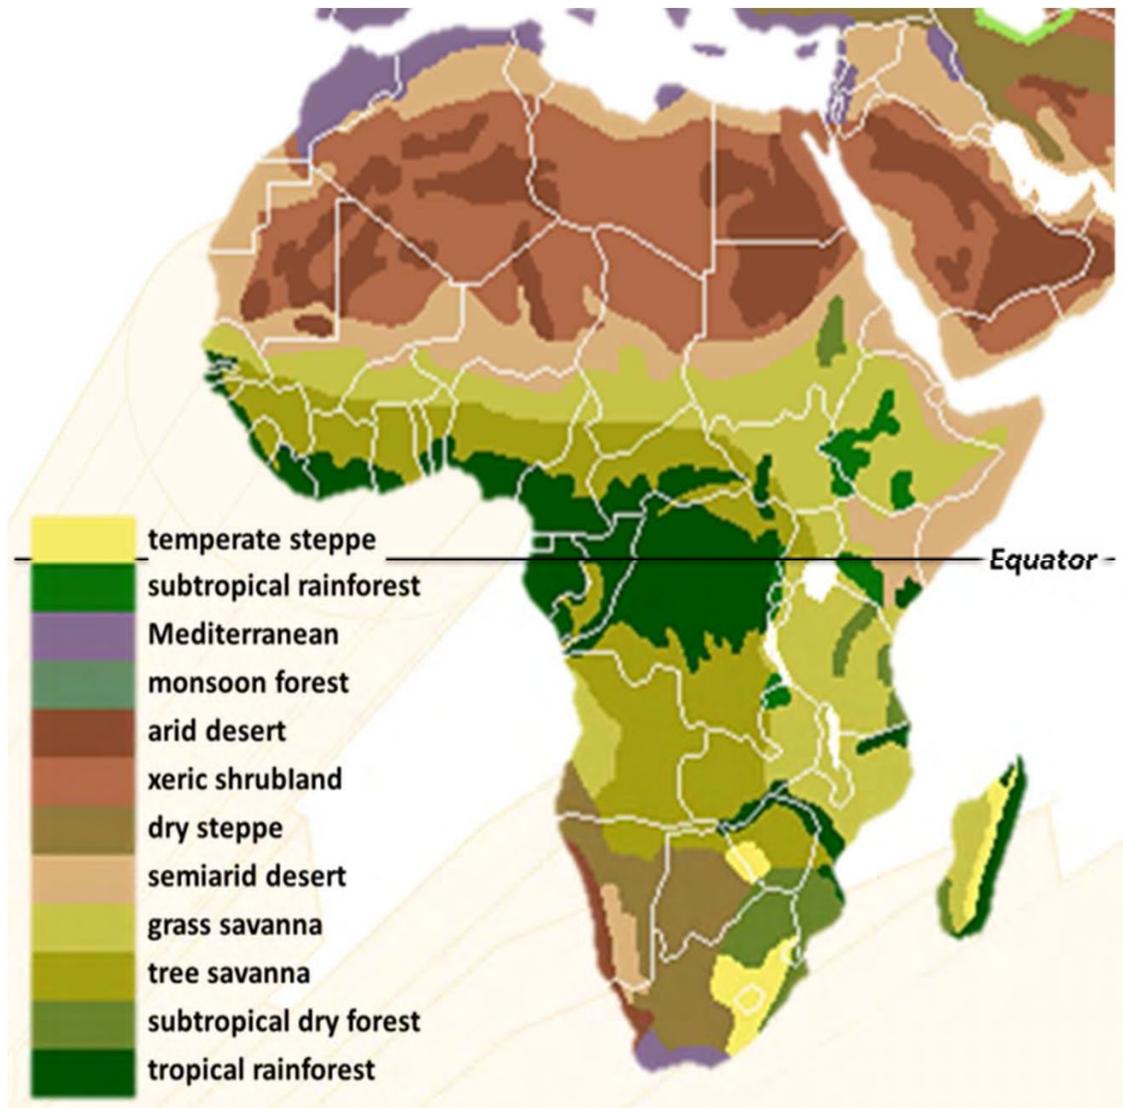

These days, the rains are either too much, leading to flooding during which crops are washed away or the rains are too inadequate, leading to crops drying up prematurely.

# Why bambara groundnuts?

- A highly underutilized exemplar crop (Azam Ali, 2012).
- Drought tolerant and records high yields in poor soils.
- Rich source of important nutrients.
- Forms symbiotic association with root nodule bacteria fixing nitrogen into the soil.

# Distribution of bambara

- Found in most of sub-Saharan Africa
- Has spread to other parts of the world including Malaysia, Indonesia, Thailand, Papua region and South America (Somta *et al.*, 2013)
- It is an emerging food security crop

# Nutritional values of bambara

Biochemical composition		Amino acids (g/16g N <sub>2</sub> )		Minerals (mg/100g)		Fatty acids (%)	
Energy	1826KJ	Lysine	6.8	P	345	Palmitic	23.2
Proteins	25.2%	Glutamine	16.2	Ca	66	Stearic	5
Oils	7.9%	Asparagine	11.1	K	1935	Oleic	22.6
Carbohydrates	42.8%	Leucine	7.6	Mg	350	Linoleic	39.0
Fibres	12.8%	Arginine	7.0	Fe	8	Linolenic	3.1
		Phenylalanine	5.6	Mn	15	Arachidic	1.6
		Isoleucine	3.9	Zn	8	Bohenic	4.4
		Threonine	3.5	Na	12	Eicosenoic	0.8
		Tyrosine	3.5	Cu	1

# Biological nitrogen fixation

- Bambara groundnut forms  $N_2$ -fixing symbioses with soil rhizobia (Sprent, 2009).
- Convert  $N_2$  into  $NH_3$  by infecting and establishing in plant roots (Dakora, 2014).
- Currently, there is little information on the most efficient groups of rhizobia in soils of Lake Victoria basin.

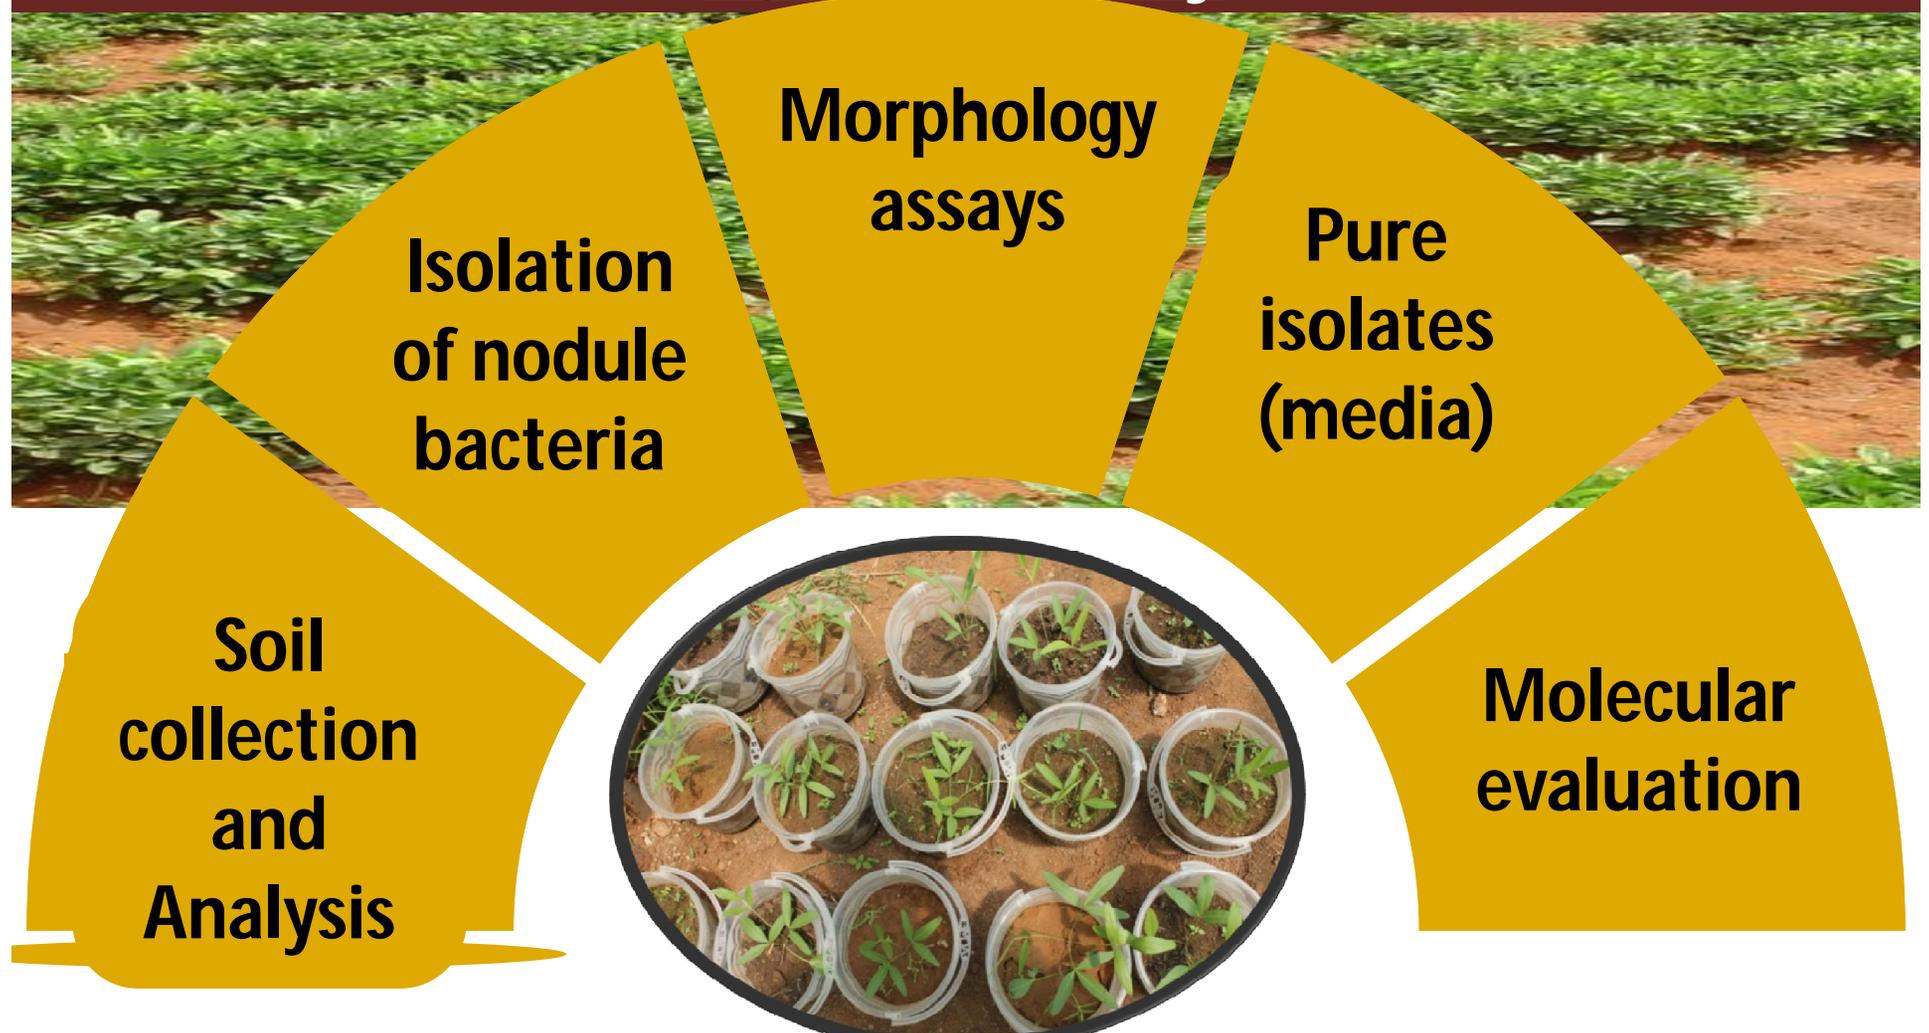

# Research strategy

- Isolation of root nodule bacteria
- Identification of isolates
  - Morphological identification
  - Multiple gene sequencing and phylogenetics.
  - 16S rRNA, *nifH*, *nodC* and housekeeping genes *atpD* and *recA*
- Specificity of isolates
  - Evaluate symbiotic functioning and nitrogen fixation.

# METHODS

## a) Biodiversity

16S rRNA, nifH,  
nodC,  
recA, glnI, atpD  
genes

Sanger sequencing to identify root nodule bacteria

## b) Symbiotic efficacy

**Pre-germination  
of bambara  
seeds**

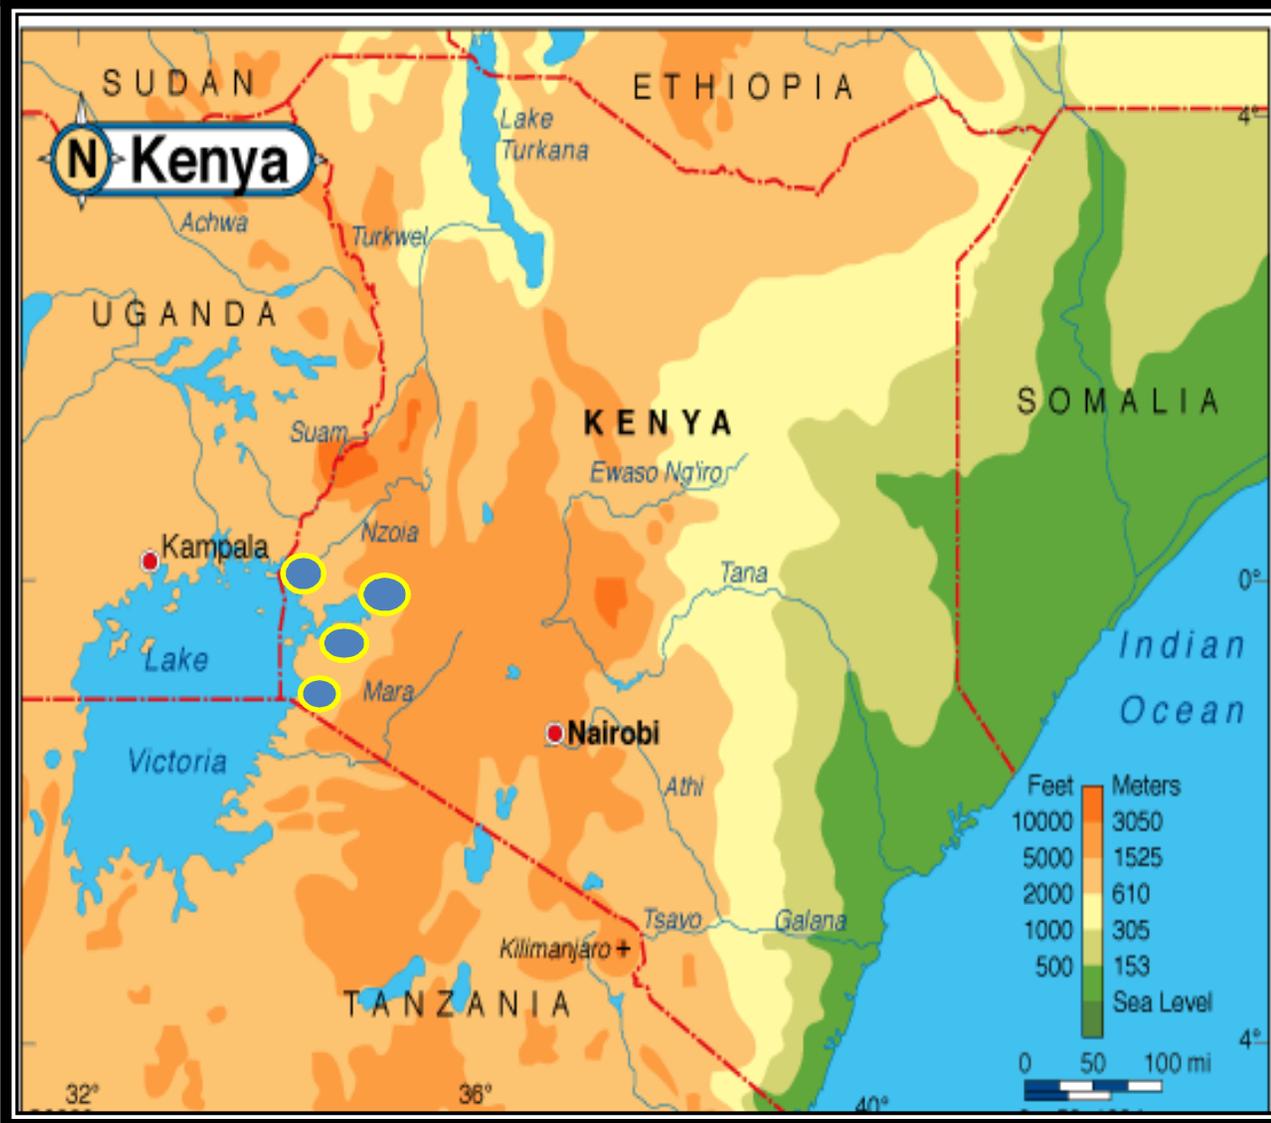

**Inoculation with  
isolates**

**Nodulation  
and N-  
content**

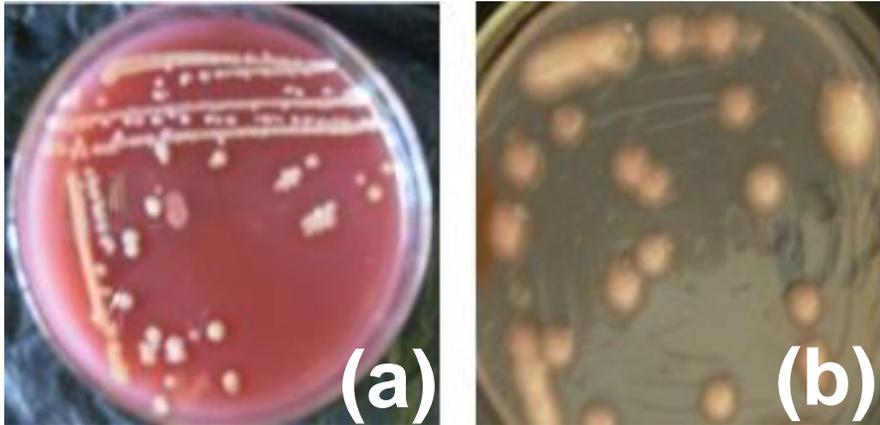

# Sample collection sites

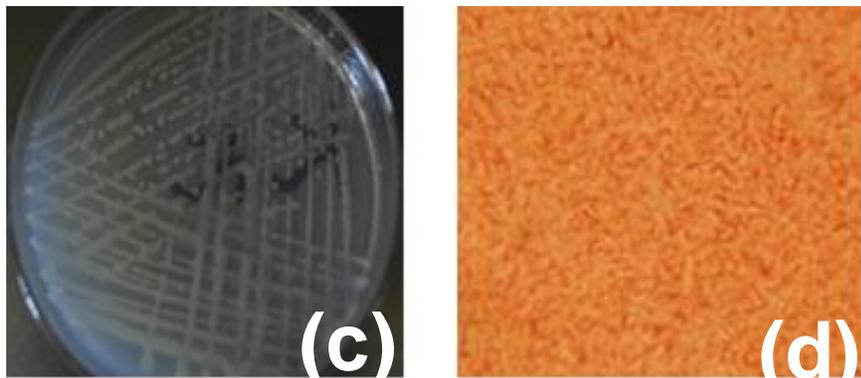

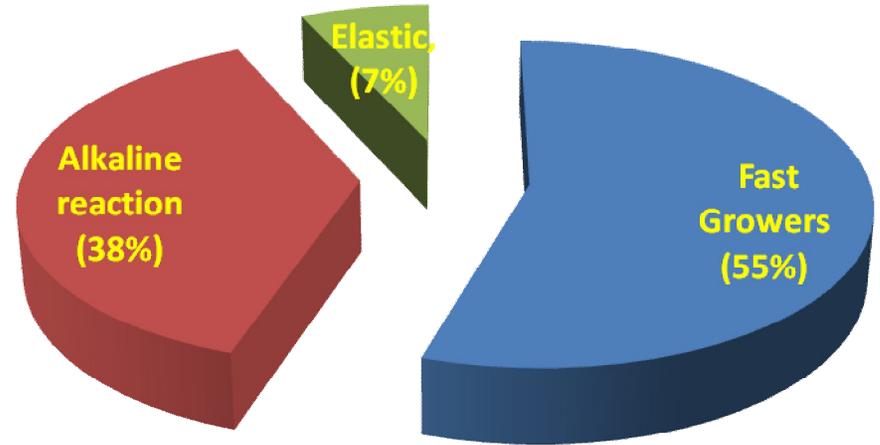

Site	No.
<b>S1 – Port Victoria</b>	<b>35</b>
<b>S2 – Kisumu</b>	<b>40</b>
<b>S3 – Kendu bay</b>	<b>35</b>
<b>S4 – Karungu</b>	<b>40</b>

# OUTCOMES

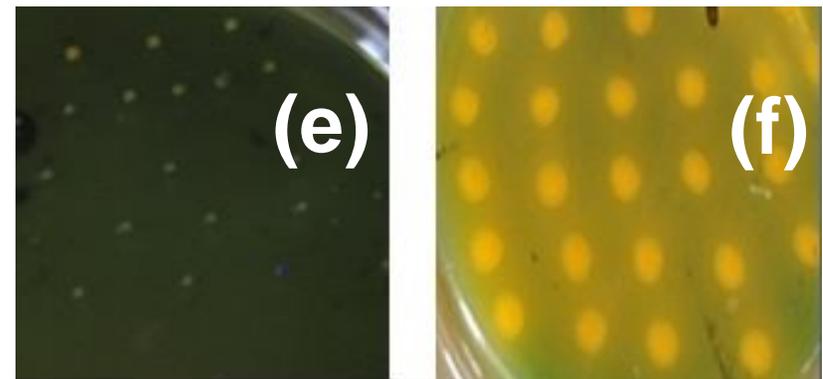

## Morphological assays

**Rhizobia isolates on Congo Red**  
**(a) slow growing rhizobia**  
**(b) fast growing rhizobia**

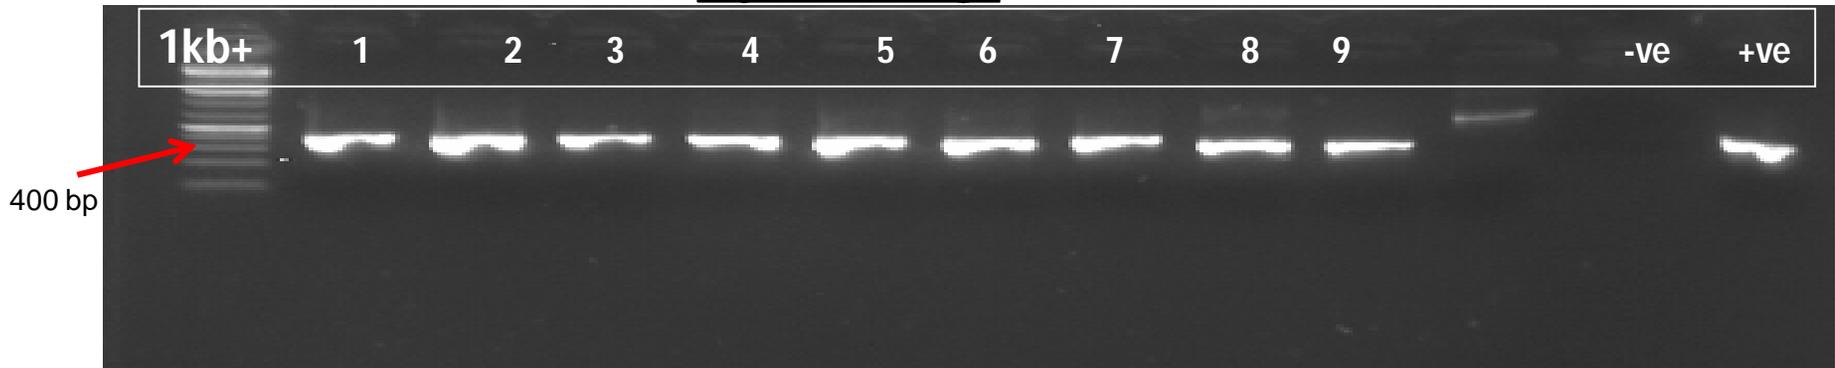

**(e) Growth on YEMA at pH 6.8**  
**(f) Gram negative rod cells**

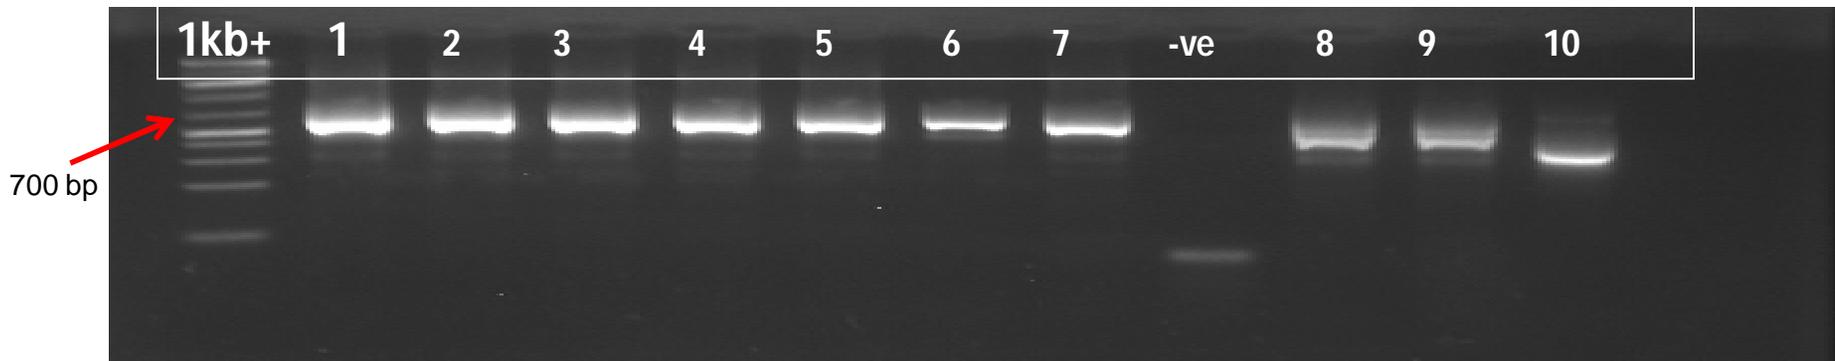

**Rhizobia isolates on Bromothymol blue**  
**(c) alkali producing rhizobia**  
**(d) acid producing rhizobia**

# Conclusions

- The results confirm diverse groups of rhizobium bacteria in Lake Victoria basin soils. *Rhizobium sp.* is the most dominant with *Bradyrhizobium* and *Sinorhizobium* less dominant.
- 12 strains were effective on bambara with *B. japonicum*, *R. tropicii* and *R. etli* producing the highest number of nodules, nitrogen content of leaves and yield biomass.
